BSDS 100 Case Study

Jacques Sham & Charles Siu

April 03, 2018

Part 1: Executive Summary

!!DOTO: No more than 250 words explaining, with extreme concision, your data and findings!!

Part 2: Introduction to the Data

First, let's clean the data.

```
# Rename the column names
names(data) <- c("date", "operAirline", "operCode", "airline", "code", "isDomestic",
                 "region", "type", "category", "terminal", "area", "pax")

# Convert isDomestic to boolean
data$isDomestic %<>% recode("Domestic" = T, "International" = F)

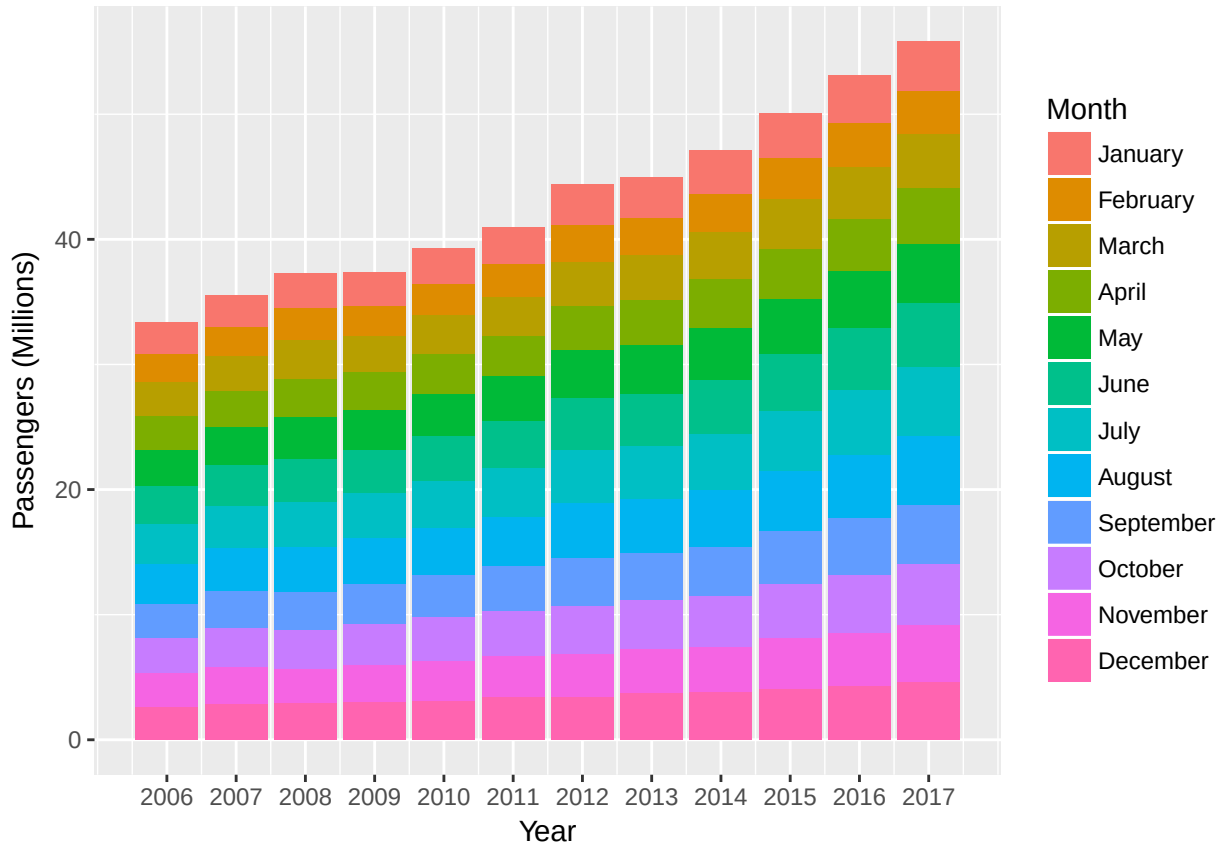
# Reformat the dates into Date objects
data$date %<>%
  as.character() %>%
  as.yearmon("%Y%m") %>%
  as.Date()

# Get month and year values
data %<>%
  mutate(month = date %>% format("%m") %>% factor(labels = month.name),
         year = date %>% format("%Y") %>% as.numeric())

# Remove data from 2007 for easy comparison
data %<>% filter(year != 2005)

## operAirline = Operating Airline, the airline that really operating, some airline would own a child c
## operCode = Operating Airline Code
## airline = Published Airline, mother company airline
## code = Published Airline Code, code for variable "airline"
## isDomestic: If the flight is domestic,T; if international: F
## region: Geom region
## type: activity type; Deplaned means arrival, Enplaned means departure, Thru / Transit is other
## category: Airline price type; Low fare is Low cost carrier, else are others
## terminal: SFO terminal
## area: area within SFO terminal
## pax: passenger count of given row
```

```
data %>%
  ggplot() +
  geom_bar(aes(x = year, y = pax / 1000000, fill = month), stat = "identity") +
  scale_x_continuous(name = "Year", breaks = seq(2006, 2017, by = 1)) +
  scale_y_continuous(name = "Passengers (Millions)") +
  scale_fill_discrete(name = "Month")
```



```
world <- map_data("world")
